

# CONTENTS

	<b>Introduction</b> . . . . .	1
1.	<b>Physiological foundations</b> . . . . .	6
1.1	<b>Basic mechanisms and functions</b> . . . . .	6
1.1.1	The discovered cellular capillary wall switching mechanism of the blood microcirculation with varying effects in the lung and other body tissue . . . . .	6
1.1.1.1	Ideas on the triggering of the switching mechanism of the blood microcirculation at the venous end of the capillaries . . . . .	6
1.1.1.2	Differences in the triggering of the switching mechanism in the various organs and tissues. Relationship to the degree of effectiveness of the O <sub>2</sub> multistep therapy procedures . . . . .	10
1.1.2	The O <sub>2</sub> partial pressure and the proportion physically dissolved in the blood during and after O <sub>2</sub> multistep therapy . . . . .	15
1.1.3	O <sub>2</sub> binding curves and exhaustion of the O <sub>2</sub> binding capacity of the blood . . . . .	16
1.1.4	Increase in the O <sub>2</sub> delivery to the tissue by means of artificial reduction of the O <sub>2</sub> affinity of hemoglobin . . . . .	17
1.1.5	The determination of the resting O <sub>2</sub> status and further characteristic values . . . . .	18
1.1.5.1	Definition of the resting O <sub>2</sub> status . . . . .	18
1.1.5.2	Time of day for determination . . . . .	20
1.1.5.3	Determination of the arteriovenous saturation difference $\eta$ at rest as a relative characteristic value of the O <sub>2</sub> status . . . . .	20
1.1.5.4	Determining the resting O <sub>2</sub> uptake of the organism as an absolute characteristic value of the O <sub>2</sub> status . . . . .	28
1.1.5.5	Determining the maximal O <sub>2</sub> uptake as a characteristic value of the energetic reserves of the organism . . . . .	31
1.1.5.6	Determining the lung function parameters . . . . .	32
1.1.5.7	Determining the resting CO <sub>2</sub> production as a characteristic value of the oxygen utilized by the organism . . . . .	32
1.1.5.8	Determining the physical performance capacity . . . . .	33
1.1.5.9	Determining the optical reaction time . . . . .	35
1.1.6	Establishing and influencing the "biological" age . . . . .	36
1.1.7	Methods of assessing the blood microcirculation . . . . .	37
1.1.8	The effect of the cellular switching mechanism of the microcirculation in the lung; effects of $P_{O_2-art}$ . . . . .	39
1.1.8.1	The loading of the blood with oxygen . . . . .	39
1.1.8.2	The reduction in the $P_{O_2-art}$ due to age and stressful influences . . . . .	41
1.1.8.3	The reduction in the $P_{O_2-art}$ due to stressful influences . . . . .	44
1.1.8.4	The increase in the $P_{O_2-art}$ by means of O <sub>2</sub> multistep therapy procedures and exercise . . . . .	47
1.1.8.5	The level of $P_{O_2-art}$ and $\eta$ , and its relation to the amount of circulatory reserves . . . . .	52
1.1.8.6	Lung-conditioned, O <sub>2</sub> MT partial nonresponders; influencing factors, contra-indications . . . . .	54
1.1.8.7	Further causes for lung-conditioned partial therapy nonresponders; distribution disorders; proportion of the arteriovenous shunt volume . . . . .	60
1.1.9	The effect of the cellular switching mechanism of the microcirculation in the other body tissue; effects of $P_{O_2-ven}$ . . . . .	61
1.1.9.1	Change in the diffusion parameters of the capillary system . . . . .	61
1.1.9.2	Slight drop in the $P_{O_2-ven}$ with age; dependence of the $\eta$ -value on age . . . . .	62
1.1.9.3	The increase in $P_{O_2-ven}$ due to stressful influences, particularly in conditions of weakness . . . . .	63
