

Constituent Parts.

Lime	11,0
Silica	2,0
Alumina	1,0
Magnesia	13,5
Oxyd of Iron	0,7
Boracic acid	68,0

Westrumb. Naturfors. Freund. t. b.

Geographic and Geognostic Situation.

It has hitherto been found only imbedded in gyps, and but in one place, that is in the upper part of the hill of Kalkberg near Lüneburg in Hanover.

Observations.

1. Lazius who discovered it, named it cubic quartz, and Westrumb, who first analyzed it, boracic spar.
2. Hauy finds that by heating it affords positive and negative electricity. An account of his experiments is to be found in his tracts.
