MINERAL REPOSITORIES. 246

The following characters of these depots or formations were ascertained by WERNER, after numerous examinations of this district during the course of thirty years *.

He describes eight principal depots of metalliferous veins, without including other less confiderable ones. These depots are well distinguished from each other, and they generally contain many metals. the defeription of a vein

1st Depot.—Lead-glance Depot or Formation.

The first, and unquestionably the oldest, of these depots, is the one we are now about to describe. It has been known from the earliest period of the working of the mines of Freyberg, and has afforded uninterruptedly much lead and filver, and small quantities of copper; and it still continues to afford the fame ores.

These ores are the following:

Large and coarse granular lead-glance, containing from an ounce and a half to two ounces and a half of filver in the quintal.

Common arsenic-pyrites.

Large and coarse granular black-blende.

Common iron and liver pyrites, and fometimes alfo fmall portions of

Copper-pyrites, and Sparry ironstone. The

These descriptions are extracted from Werner's Treatise on Veins.
