External Characters.

Its fresh colour is intermediate between copper-red and pinchbeck-brown; it however soon acquires a tarnish, which is first reddish, then the red passes successively into violet-blue, azure-blue, and sky-blue, and lastly into green; yet several of these colours are to be observed on the same mass, so that it has a variegated aspect, and of these colours the blue is usually the predominant, and the green occurs only in spots.

It occurs massive, disseminated, in plates, in membranes; and crystallised in the following figures:

1. Cube, in which the faces are sometimes curved.
2. Cube truncated on all the angles

Internally it is shining or glistening, and the lustre is metallic.

The
