

"I had to get a lot of women, put them on a table, and, in the presence of my wife, measure their legs and their strides. And then, having two sides of the triangle, I was able by a mathematical formula to figure out the third side, which was the stride.

"I finally got together a set of figures that are absolutely priceless for my purposes, and I think that I shall give my original calculations to the British Museum for their historical records!"

Kaete Wilczynski

Mr. Mackenzie-Kennedy, who has patented his idea in all the leading countries, came to Paris this week to give the first demonstration of his new model to the Paris dressmakers.

"The majority of the dressmakers thought highly of it for sports clothes," he explained, "but the question invariably came up whether the pretty Parisienne really wished to hide her legs, and that has to be found out."

The inventor is now going to send mannequins to the Paris races with his new model to find out if it is popular.
